Tbilisi, Georgia

Fixed-source Monte Carlo particle transport algorithms design and implementation, HPC-code design, radiation shielding design and optimization.

EDUCATION

IATE NRNU MEPhI 2005 – 2011

Engineer-physicist in nuclear reactors and power plants, Specialist Degree (an equivalent to MSc)
Obninsk, Russia

- Three years long research work on variance reduction techniques for Monte Carlo gamma transport: design, implementation in the gamma part of the BRAND MC particle transport code, validation, and efficiency studies (Supervisor: Prof. P.A. Androsenko)
- Graduate thesis title: «Development of the Monte Carlo method modifications for radiation shielding evaluations» (Supervisor: Prof. P.A. Androsenko)

EXPERIENCE

IATE NRNU MEPhI 2009 – 2013

Laboratory Assistant / Teaching Assistant *Obninsk, Russia*

- Assisting to computational equipment maintenance;
- Assisting to student programming courses teaching.

JSC «Engineering Center of Nuclear Containers» 2011 – 2021

Lead Modeling Engineer / Branch Chief *Obninsk, Russia*

- Providing physical simulations for the maintenance of spent fuel and radioactive waste casks, storage facilities (including dry cask storage installations), and miscellaneous equipment design:
 - Fuel depletion and materials activation calculations including neutron transport modeling;
 - Radiation shielding evaluations using BRAND;
 - Criticality safety evaluations;
- Providing R&D on the described above fields for the equipment design optimizations;
- Examination maintenance of the designed safety evaluations in Russian and Chinese regulatory authorities.

Independent R&D 2011 – present

R&D of MC techniques for shielding *Obninsk, Russia / Tbilisi, Georgia*

- Development and maintenance as a pet-project of the BRAND code neutron and gamma parts (legacy codebase); a shielding calculation methodology [6] was designed, implemented, and successfully used in my engineering practice, which includes the following:
 - Variance reduction techniques for photon and neutron transport, such as exponential transform modification for convex shields, the coupled location-direction source importance sampling technique and Simplified Adaptive Splitting techniques;
 - Multi-Kernel Geometry Module for MC particle transport;
 - Some specific for equipment design process MC-techniques, such as multi-case computation techniques and automated producing spent fuel qualification tables scheme for cask;
- Investigations for novel promisable MC-approaches (unpublished);
- Design of general-purpose automated adaptive variance reduction scheme and its implementation (unpublished).

RESEARCH INTERESTS

<i>Comp. Math.</i>	Monte Carlo integration, variance reduction, Neumann-Ulam scheme, Sequential Monte Carlo
<i>Programming</i>	Design of high-performance computational physics codes and computational algorithms, performance optimization of implementations
<i>Appl. Physics</i>	Neutral and charged particles transport, radiation shielding, radiotherapy, reactor physics

OPEN SOURCE CONTRIBUTIONS

CMake	2022
Fixed a bug in the Fortran sources parser	
OpenMC	2025 – 2026
Preliminary contributions for the shielding methodology re-implementation	
<i>Most of the PRs stalled</i>	

TOOLS

<i>Prog. lang.</i>	Fortran (legacy and modern) – experienced; C, C++ – familiar
<i>Supplementary</i>	CMake, Git
<i>Physical codes</i>	SCALE (KENO, TRITON/KENO, TRITON/NEWT, etc.), BRAND
<i>OS</i>	Windows, Linux (Ubuntu)
<i>Language</i>	Russian, English
